

## Week 4 summary (11-18.03.2015)

**Sprint target: Running components and registration to server.**

### **Achieved:**

1. Initial server implementation with parameters handling
2. Initial node implementation with parameters handling
3. Initial task manager implementation with parameters handling
4. Registration handling on server side
5. Computational node registration
6. Task manager registration

### **Moved to next sprint:**

1. Prepare communication tests outline:

Communication library that was meant to be defined and created was moved to next sprint, current communication solution is hard to automated testing.

2. Create wrapper for message sending:

Wrapper for communication will be created based on current solution – it will clarify during implementation of mock dispatcher in Week 5. In Week 4 did not have enough knowledge to create such wrapper.

3. Initial client implementation with parameters handling:

As it appeared after tasks definition, Computational Client is not registering to Communications Server. Client will be created in Week 5 when support for problem instance input will be added.
